

WHO IS RETRIEVER COMMUNICATIONS?

Retriever are Industrial Mobility Specialists

Retriever Communications specializes in improving the productivity of mobile workers by designing industrial strength mobility solutions.

Retriever software enables the development, deployment and management of robust, secure, cross platform, internationalized native mobile applications, hosted in the cloud (SaaS) or within the enterprise. Retriever applications operate across any IP based network, including the Internet, GSM, GPRS, 3G and 4G mobile networks, Wi-Fi and corporate Ethernet networks.

Retriever also offers the **Barking suite**, a range of 'configurable-off-the-shelf' (COTS) mobility solutions designed to fit specific industry needs. Each Barking product is seamlessly tailored to fit into your own business workflow and back-office system requirements & can be deployed in the field in just weeks.

All the Retriever solutions run across mobile platforms so your decisions are not based on hardware but what benefits can be provided through mobilising your field service operations. Retriever is a "mobile enterprise application platform" or MEAP for B2B or B2E environments.

Provide your field with the tools necessary to:

- ✓ Capture complete and accurate information on site
- ✓ Dynamically update their activity & status in the office
- ✓ Complete work faster than ever before

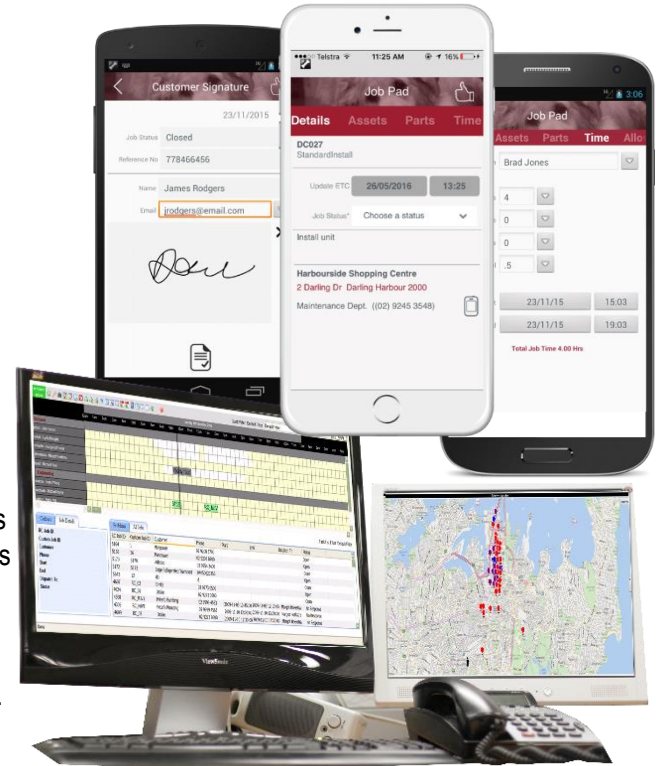

WHO IS RETRIEVER COMMUNICATIONS?

Retriever Solutions

The four main components of a Retriever field mobility solution include:

- Retriever Mobile** – Retriever mobile pushes job and relevant job information to mobile workers who can then capture signatures, parts, complete time sheets, checklists and site risk assessments. Real-time synchronization and encrypted data transfer makes it an ideal solution for managing the mobile field.

Runs on: Windows, Android & iOS
- Retriever Schedule & Dispatch** – Assign work and dispatch dynamically out to the field, managed through Retriever's Web 2.0 scheduler. It provides the technology required for efficient job planning, assignment, update and dynamic field connectivity.
- Retriever Applications Development Environment (ADE)** – A user interface tool that gives companies a low-risk platform for developing and deploying mobile field solutions. The tool enables business analysts to design application interfaces that function in a logical way without the need for programming. It is also a powerful tool for rapid prototyping.
- Retriever FormBuilder** - Retriever's standalone tool for easily creating device agnostic electronic forms. The tool is specifically designed for use by non-IT staff

WHO IS RETRIEVER COMMUNICATIONS?

About Retriever Communications

A global expert in Field Service Management headquartered in Sydney and with additional development and support in the US and staff in Europe. For 20 years, Retriever has been partnering with clients to drive operational efficiency by mobilising workforces, advancing delivery of service and improving asset management.

Retriever provides off-the-shelf and bespoke mobile applications which are built to work in or out of coverage alongside a scheduling solution for efficient job planning, crew assignment and work-order planning. With a 100% deployment success rate, Retriever tailors and configures solutions for industries from Utilities to Environmental including field service maintenance, inspections, environmental testing, OH&S whilst integrating to GIS, Engineering and ERP systems.
